

SafeSend™ Outbound Filtering

Much of the email security industry today focuses on inbound threat protection, and many companies imprudently downplay the importance of adding protection from email threats and abuse within the organization. SafeSend Enhanced Outbound provides this vital layer of protection, allowing you to protect your company's reputation and preventing sensitive information from being leaked via email.

Protect your business and safeguard its reputation

Protects from spam proliferation

Inadvertently sending spam and viruses makes you look bad, but our advanced filtering capabilities keep the blame for viruses and spam from coming back to your company.

Stop email w/banned attachments

SafeSend gives your administrators the ability to define which attachment types are detected, and then lets you assign custom actions such as BCC, quarantine, or destroy.

Prevents sensitive info leaks

Utilize pre-defined content lexicons to secure data such as Social Security or credit card numbers, or create custom rules to cover your specific policies or legal compliance needs.

Improves email deliverability

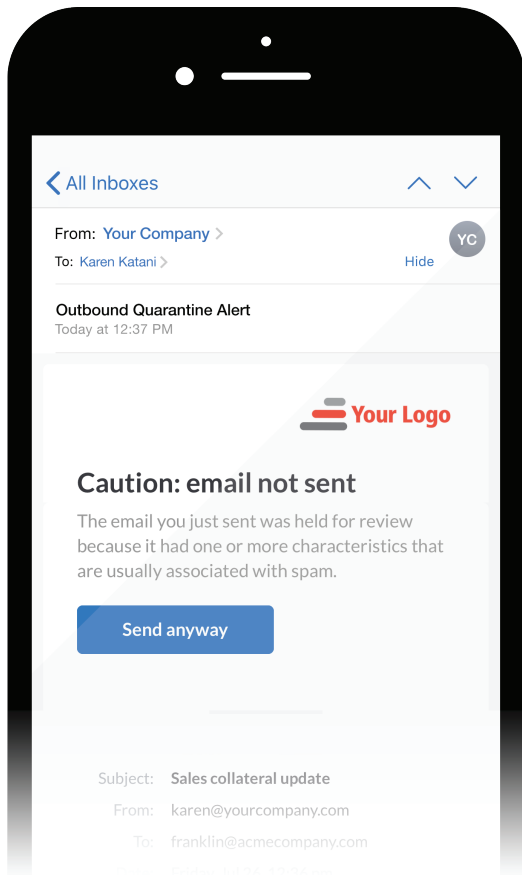

Clean internal email in the cloud significantly lowers the risk of improper routing and noncompliant messages and strengthens your image of professionalism.

See which recipients support TLS

SecureCircle™ checks to see if your contacts accept TLS encrypted email. If they do, you can force SafeSend to always use TLS when sending to certain addresses or domains.

Regulatory compliance footers

Create totally customizable email footers so you comply to the legal regulations and standards required by your industry. All email sent from your domain will include your footer.

Realtime blocking notifications

If someone tries to send an email that violates company policy or contains malicious content, SafeSend will block the email and immediately notify them that the message was held. If the administrator permissions allow it, they can easily release the email for delivery with a single click.

Policy-based outbound compliance

SafeSend gives administrators the ability to define which content is not permitted for email distribution. Utilize pre-defined content lexicons to secure data such as Social Security or credit card numbers, or create custom rules to cover your specific policies or legal compliance needs.

Inadvertently sending spam and viruses makes you look bad. SafeSend takes all the awesome features of CloudFilter's advanced filtering systems and adds more outbound message management such as email footers, TLS encryption enforcement and policy based compliance.

Custom footers

Government regulations such as Sarbanes-Oxley, HIPAA, and Gramm-Leach-Bliley, have created the need for companies to comply with email-based regulations. SafeSend lets you add a compliance message in the footer of every outbound message, helping your organization keep up with current standards.

Add a footer to the message

Insert text at the end of the message.

Footer text:

The information contained in this email message is privileged and confidential and is intended only for the use of the addressee. If the reader of this message is not the addressee, or the person responsible for delivery to the addressee, you are hereby notified that any dissemination, distribution or copying of the message is strictly prohibited. If you have received this message in error, please immediately notify us by return email and immediately delete this message from your system. All Proposals and Quotes are Confidential and subject to Audit and may result in correction due to
